## INTRODUCTION

Your Schmeiser Tri Plane Land Leveler is designed to give you many years of dependable service. This manual has been prepared to instruct you in the safe and efficient operation of this machine. Read and study it thoroughly. Follow all instructions carefully.

Should your Tri Plane Land Leveler require replacement parts, go to your Schmeiser dealer. Always order genuine Schmeiser replacement parts.

It is important that you complete and send in your Warranty Card because it is not valid unless it is on file at Schmeiser. If you need information not contained in this manual, contact your Schmeiser dealer.

Space has been provided below for you to record the model number and serial number of your Tri Plane Land Leveler. Be sure to bring this information with you to your dealer when ordering parts for your Tri Plane Land Leveler.

Thank you for buying a Schmeiser Tri Plane Land Leveler.

# SAFETY

The safe operation of any machinery is an important concern to farmers and manufactures. There are obvious and hidden potential hazards involved in the operation of this implement. Carefully read and follow all safety precautions before operation. Serious injury or death may occur unless care is taken to insure the safety of both the operator and any other persons in the area.

1. Never permit anyone to ride on or walk beside the implement when moving.
2. Never permit anyone to ride on tractor when implement is being moved.
3. Before starting machine, always check area around machine to verify that all personnel are clear.
4. Never connect hydraulic lines or operate any portion of the machine unless machine is hitched to tractor.
5. Do not operate hydraulic systems when hydraulic leaks are present.
6. Before transport or unhitching, always tie back hydraulic hoses.
7. Do not exceed 2000 psi working pressure or 2500 psi maximum pressure on hydraulic system.
8. When performing operating functions, never allow anyone to be near the implement or the tractor.
9. Do not enter tractor when tractor is moving. Avoid serious injury or death from contact with rotating tires. Enter and exit the tractor only when it is completely stopped.
10. Always operate machine in a careful, controlled manner.
11. Personnel operating and working with this machinery must not wear loose, dangling or unbuttoned clothing which could tangle in machinery.
12. Be sure of water, gas, sewer, or electric line locations before operating implement.
13. When in transport, use accessory lights and devices for adequate warning to operators of other vehicles.
14. Comply with all Federal, State and local laws when traveling on public roads.
15. Use "Slow Moving Vehicle" emblem for warning vehicles approaching from the rear.
16. When transporting, remember that the implement may be wider than your tractor and extreme care must be taken to allow for safe clearance.
17. Never allow inexperienced or untrained personnel to operate the implement or tractor.
18. When using compressed air to clean implement, wear safety glasses.
19. Check all fasteners for tightness or damage before and after operation. Repair immediately if required.
20. Before transport, inspect lug bolts and tire inflation.
21. Store implement in a stable position. Insure that safety stands are extended and locked in place before detaching from tractor. Before unhitching, place chocks in front and behind all transport wheels to prevent rolling when unhitched and parked.
22. Always use two people to handle heavy, unwieldy components during assembly, installation, removal, or moving.

## THE FOLLOWING TOOLS ARE NEEDED:

- Truck with lifting boom, overhead hoist or forklift with 2000 pound lifting capacity.
- A 24" adjustable wrench or large pipe wrench.
- One 6" and two 12" adjustable wrenches.
- Socket wrench with 15/16" and 1-1/2" sockets.
- Heavy duty pliers.
- A heavy duty 12" screwdriver.
- A 14" tapered drift punch.
- A pry bar.
- A medium size ballpeen hammer.
- A ten-pound sledge hammer.
- Grease gun.

## PROCEDURE:

1. Place the main frame with the front bearing clamp toward the front on level ground. Raise front and put wooden block about 4" high underneath it. Place the left rear main frame butt to butt with the left front main frame. Join together. Line up the mating holes and install (2) 1-1/4" NC x 4-1/2" Gr.8 bolts with lock washers and hex nuts and (1) 5/8" NC x 2" bolt with lock washer and hex nut in the hole near the bottom 1-1/4" NC bolt. Do not tighten.
2. Hoist the center cross frame (see drawing on page 11 – item # 20) up with sling or chain attached to the 3" x 3" tube so that the cross frame is parallel to the ground and oriented to the square hole in the upper middle section of the left main frame. Line up the mating holes on the main frame and install (2) 1-1/4" NC x 4-1/2" Gr.8 bolts with lock washers and hex nuts and (1) 5/8" NC x 2" bolt with lock washer and hex nut in the hole near the bottom 1-1/4" NC bolt. Make sure the cross frame is positioned so that the attaching bracket on the bottom side of the 3" x 3" square tube is flush on the side facing the forward end of the machine. Now slide the end of the square tube through the square hole in the frame until the two attaching holes match up. Install one 1" x 4" bolt with lock washer and hex nut and one 1" x 3" bolt with lock washer and hex nuts. Do not tighten. Keep center cross frame suspended.
3. Place the right rear main frame butt to butt with the right front main frame. Join together. Be sure that the end of the center cross frame square tube goes through the square hole in the right side of the main frame until the two attaching holes match up. Install one 1" x 4" bolt with lock washer and hex nut and one 1" x 3" bolt with lock washer and hex nuts. . Line up the mating holes on the main frame and install (2) 1-1/4" NC x 4-1/2" Gr.8 bolts with lock washers and hex nuts and (1) 5/8" NC x 2" bolt with lock washer and hex nut in the hole near the bottom 1-1/4" NC bolt. Do not tighten.
4. Install rear inside frame (see drawing on page 11 – item # 27). Use (4) 5/8" NC x 2" bolts, lock washers and hex nuts. Tighten all bolts securely.
5. Lift up front of the machine. Open up front clamp BC-400 and install the front steel wheel frame and main frame pivot shaft assembly (with bearing housing, thrust bearing, inner races, pin bearings,

shaft cap, oil seal & dust cap) into the bearing clamp opening on the front end of the right and left main frames. Join the bearing clamps together and line up the six mating holes. Install six 3/4" NC x 2" bolts, lock washers and hex nuts. Tighten up enough to hold bearing housing in place.

6. Install front pivot shaft lockout (with two slotted holes). See drawing on page 11 - item # 8. Use two 3/4"NC x 2" bolts, flat washers, lock washers and hex nuts. Tighten securely. Place lock pin in position.
7. Position rear cross frame with attached steel wheels against the mounting plates on the rear end of the main frame. Guide stops on the rear cross frame should be next to mounting plates on the main frame. Adjust main frame height (if necessary) so that the two 8" U-bolts (see drawing on page 11 – item # 31) can be placed around the rear cross frame tube and inserted through the four mating holes in the end plate of the rear main frame. Install four 7/8" NF hex nuts and lock washers. Make necessary sideways adjustments and tighten securely.
8. Put bucket with attached bucket arms beside main frame with pull arms facing forward. Place piece of pipe underneath bucket. Push bucket from one end under main frame until bucket arms align with bucket cross brace. Fasten with 1" x 4" bolts and nylon lock nuts. Do not tighten.
9. Mount top turnbuckle stub (see drawing on page 17 – item # 6) to center cross frame using 1/2" x 1-1/2" bolt with lock washer and turnbuckle end plate. Tighten securely.
10. Screw turnbuckle body (see drawing on page 17 – item # 5) onto top stub leaving 4" of thread showing. Screw in lower turnbuckle stub (see drawing on page 17 – item # 4). Leave about 4" of thread showing.
11. Attach longer end of T-Bar link (see drawing on page 17 – item # 3) to lower turnbuckle stub using 1" x 3-1/2" bolt with zerk fitting and secure with 1" nylon lock nut.
12. Install adjustment rod (see drawing on page 17 – item # 1) on the bucket using (2) 1" jam hex nuts.
13. Mount one end of straight link (see drawing on page 17 – item # 2) to adjustment rod using 1" x 3" bolts with lock washers and hex nuts. Do not tighten.
14. Connect top hole of bucket axle clevis plate with bottom hole of T-Bar link using 1" x 6-1/2" bolt with zerk fitting and secure with 1" nylon lock nut. Line up other end of straight link with the T-bar link end hole. Lift front section of the machine from under main frame until bucket turnbuckle is in vertical position and the mating holes line up. Install 1" NC x 3" bolt with zerk fitting; then install 1" nylon lock nut. Make sure the grease fitting is facing out.
15. Tighten adjustment rod jam nuts and 1" hex nut. Make sure that all bolts with nylon lock nuts are secure but able to move.
16. Repeat same procedure for the other side.
17. Push the tire axle (see drawing on page 11 – item # 22) under the main frame. Align the tire axle so that when mounted to the rear of the bucket, the cylinder anchors are on the backside toward the rear cross frame. Now push the tire axle up until the legs slide into the gussets on the rear of the bucket. Line up the holes and insert a 1" NC x 3-1/2" bolt with zerks, through each hole. Install a nylon lock nut on each bolt and tighten.

18. Install hydraulic pipe with attached flow divider from the back side of the machine sliding it under center cross frame toward the front. Place the second hydraulic pipe on top and secure with double pipe clamps.
19. Attach 3" x 8" welded hydraulic cylinders (see drawing on page 31 – item # 11) with rod ends facing away from bucket to the tire axle.
20. Install 41" hoses into the lower port of the cylinders and upper set of cross pipes. Install the 33" hoses into the upper port of the cylinders and the lower set of cross pipes. Use thread sealant on all pipe and hose joints. Support the piping with five double pipe clamps. Use five 5/16" NC x 2-1/2" bolts, lock washers and hex nuts.
21. Install two short cross rods between the center cross frame and the rear inside frame. Use two 5/8" NC x 2" bolts, lock washers and hex nuts at center cross frame and two 5/8" NC x 2" bolts, lock washers and hex nuts at the rear inside frame end. Leave the rod assemblies loose.
22. Now install the two long cross rods between the rear inside frame and the rear cross frame. Use two 5/8" NC x 2" bolts, lock washers and hex nuts at the rear end of the main frame and two 5/8" NC x 2" bolts, lock washers and hex nuts at the rear inside frame end. Leave the rod assemblies loose.
23. Tighten up all eight cross rod attaching bolts.
24. Tighten up all four cross rod turnbuckles sufficiently to square up the frames. Install the cross rod U-bolts (see drawing on page 11 – item # 35).
25. Make a final check of the assembled Land Leveler. Cross rods should be tightened. The jam nut should be locked up against the turnbuckle. The front turnbuckle must be adjusted correctly. Lock pins should be in place. Make sure all frame and cross member bolts are tight. 8" U-bolts must be tight and positioned correctly on the rear cross frame. Grease all zerck fittings prior to operation.

## TO TRANSPORT THE LAND LEVELER ON THE ROAD:

1. Move the bucket to its lowest position, then install the cylinder locking bars. The tire axle will be up and lock pins in place. Remove both lock pins from the tire axle. Lower the tire axle hydraulically until the lock pins can be reinserted into the same holes. This will lock the wheels into the transport position with the rear steel wheels off the ground.
2. Align the tongue with the frame center line, then insert the pivot shaft lockout pin, with the wrench portion up, between the frames and through the rear hole of the front main frame pivot shaft.
3. Adjust the front turnbuckle to hookup to the tractor drawbar, and then readjust for the wheel/ground clearance desired.
4. **DO NOT TRY TO MOVE THE LAND LEVELER ON THE ROAD ON ITS STEEL WHEELS OR QUAD RUBBER TIRES. Always use the transport wheels when moving on roadways.**

## TO LOWER LAND LEVELER FOR LAND LEVELING:

1. Lower the tire axle hydraulically enough to remove the locking pins. Raise the tire axle slowly until the front or rear wheels touch the ground. Adjust the front turnbuckle until the pins are free. Remove the turnbuckle and mount it on the left pull brace with two lynch pins.
2. If the machine does not have a hydraulically actuated bucket, lift arm locks must be used on each side.
3. Remove the pivot shaft lockout pin, the 1" shaft between the front ends of the frame; place it in the pin holder bracket at the front of the machine.
4. The bucket leveling and depth adjustments are made by adjusting the lift screws located on each side of the Land Leveler.
5. Check the rear wheels for travel alignment:
  - a. Loosen both stabilizer bearing cap screws to assure that the bearing or roller is free to move in the slot.
  - b. Stretch a string from the outside of one wheel rim to the outside of the opposite wheel rim approximately 14" off of and parallel to the ground.
  - c. Adjust each wheel so that the string touches the full surface of each wheel rim with no bend in the string. (Visually check from outside of one wheel to the outside of the other)
  - d. Retighten the bearing or roller cap screws in the stabilizer.
  - e. Remove the string and now the Land Leveler is ready to use.
6. Operating the machine under adverse conditions, such as extremely rough ground, rocks or stumps, may cause the hitch end bolt to break. If this occurs, do not replace the factory installed bolt with a case hardened bolt. It is intended to be a safety shear pin.
7. **Hydraulic Cylinder option.** Adjust cylinder adjusting screw, located on the piston end of the bucket cylinder, so that the pivot point (A) is located 1/8" forward of a direct line between the upper turnbuckle; attach point (B) and the lower attach point (C) on each side of the machine. (See Drawing on the following page)
8. Adjust the bucket lift turnbuckle to "Level", set blade and working height of the bucket.
9. Recheck adjustment No. 7 above, to make sure pivot point is within tolerance (0" to 1/8"). If necessary, readjust No. 7 and No. 8 above.

NOTE: INFLATE TIRES TO 30 PSI.

## THE FOLLOWING TOOLS ARE NEEDED:

- Truck with lifting boom, overhead hoist or forklift with 2000 pound lifting capacity.
- A 24" adjustable wrench or large pipe wrench.
- One 6" and two 12" adjustable wrenches.
- Socket wrench with 15/16" and 1-1/2" sockets.
- Heavy duty pliers.
- A heavy duty 12" screwdriver.
- A 14" tapered drift punch.
- A pry bar.
- A medium size ballpeen hammer.
- A ten-pound sledge hammer.
- Grease gun.

## PROCEDURE:

1. Place the main frame with the front bearing clamp toward the front on level ground. Raise front and put wooden block about 4" high underneath it. Place the left rear main frame butt to butt with the left front main frame. Join together. Line up the mating holes and install (2) 1-1/4" NC x 4-1/2" Gr.8 bolts with lock washers and hex nuts and (1) 5/8" NC x 2" bolt with lock washer and hex nut in the hole near the bottom 1-1/4" NC bolt. Do not tighten.
2. Hoist the center cross frame (see drawing on page 11 – item # 20) up with sling or chain attached to the 3" x 3" tube so that the cross frame is parallel to the ground and oriented to the square hole in the upper middle section of the left main frame. Line up the mating holes on the main frame and install (2) 1-1/4" NC x 4-1/2" Gr.8 bolts with lock washers and hex nuts and (1) 5/8" NC x 2" bolt with lock washer and hex nut in the hole near the bottom 1-1/4" NC bolt. Make sure the cross frame is positioned so that the attaching bracket on the bottom side of the 3" x 3" square tube is flush on the side facing the forward end of the machine. Now slide the end of the square tube through the square hole in the frame until the two attaching holes match up. Install one 1" x 4" bolt with lock washer and hex nut and one 1" x 3" bolt with lock washer and hex nuts. Do not tighten. Keep center cross frame suspended.
3. Place the right rear main frame butt to butt with the right front main frame. Join together. Be sure that the end of the center cross frame square tube goes through the square hole in the right side of the main frame until the two attaching holes match up. Install one 1" x 4" bolt with lock washer and hex nut and one 1" x 3" bolt with lock washer and hex nuts. . Line up the mating holes on the main frame and install (2) 1-1/4" NC x 4-1/2" Gr.8 bolts with lock washers and hex nuts and (1) 5/8" NC x 2" bolt with lock washer and hex nut in the hole near the bottom 1-1/4" NC bolt. Do not tighten.
4. Install rear inside frame (see drawing on page 11 – item # 27). Use (4) 5/8" NC x 2" bolts, lock washers and hex nuts. Tighten all bolts securely.
5. Lift up front of the machine. Open up front clamp BC-200 and install the front steel wheel frame and main frame pivot shaft assembly (with bearing housing, thrust bearing, inner races, pin bearings,

shaft cap, oil seal & dust cap) into the bearing clamp opening on the front end of the right and left main frames. Join the bearing clamps together and line up the six mating holes. Install six 3/4" NC x 2" bolts, lock washers and hex nuts. Tighten up enough to hold bearing housing in place.

6. Install front pivot shaft lockout (with two slotted holes). See drawing on page 11 - item # 8 Use two 3/4" NC x 2" bolts, flat washers, lock washers and hex nuts. Tighten securely. Place lock pin in position.
7. Position rear cross frame against the mounting plates on the rear end of the main frame. Guide stops on the rear cross frame should be next to mounting plates on the main frame. Adjust main frame height (if necessary) so that the two 8" U-bolts (see drawing on page 11 – item # 31) can be placed around the rear cross frame tube and inserted through the four mating holes in the end plate of the rear main frame. Install four 7/8" NF hex nuts and lock washers. Make necessary sideways adjustments and tighten securely.
8. Attach rear steel wheel pivot frames to the rear cross frame. Use 1-1/2" Rear Hinge Pins with slotted hex nuts and cotter pins. Mount steel wheels to the pivot frames (see page 27 for details).
9. Put bucket beside main frame with pull arms facing forward. Place piece of pipe underneath bucket. Push bucket from one end under main frame until bucket arms align with bucket cross brace. Fasten with 1" x 4" bolts and nylon lock nuts. Do not tighten.
10. Mount top turnbuckle stub (see drawing on page 17 – item # 6) to center cross frame using 1/2" x 1-1/2" bolt with lock washer and turnbuckle end plate. Tighten securely.
11. Screw turnbuckle body (see drawing on page 17 – item # 5) onto top stub leaving 4" of thread showing. Screw in lower turnbuckle stub (see drawing on page 17 – item # 4). Leave about 4" of thread showing.
12. Mount wings to both sides of main frame bucket. Use 2-1/4" dia. Hinge Pin. Secure it in place with 3/8" X 4" NC Gr.5 Cap Screw, lock washer, and hex nut. Ensure that main frame bucket and wing buckets are lined up (see drawing on page 41).
13. Install truss rod mast frames. Center them and mount to the main frame using 3/4" x 2-1/2" NC Cap Screw with lock washers and hex nuts. Ensure that the hinge pin is secured with 3/8" x 3" NC Gr.5 Cap Screw with lock washers and hex nuts on top of the masts and the truss rod pivot bushings are in place before mounting truss rods (see drawing on page 41).
14. Mount cross brace to the truss rod mast frames using 5/8" U-Bolts with lock washers and hex nuts.
15. Mount long truss rod ends to the truss rod pivot bushings and short ends to the wing truss rod anchors. Adjust truss rod length to level wing buckets with main frame bucket.
16. Attach one of the ends of the top link ratchet (see drawing on page 43 – item # 6) to the main frame lockout ears using 1" x 4-1/2" bolt and secure with 1" lock washer and hex nut.
17. Fold the wing and place the other end of the top link ratchet between the lockout plates on the wing. Secure with 1" x 4-1/2" lockout pin and lynch pin (adjust ratchet length if needed). Tighten the top link ratchet for transport to eliminate any wing bucket movement (see drawing on page 43 - item # 6).

18. Repeat same procedure for the other side.
19. Push the tire axle (see drawing on page 11 – item # 22) under the main frame. Align the tire axle so that when mounted to the rear of the bucket, the cylinder anchors are on the backside toward the rear cross frame. Now push the tire axle up until the legs slide into the gussets on the rear of the bucket. Line up the holes and insert a 1" NC x 3-1/2" bolt with zerks, through each hole. Install a nylon lock nut on each bolt and tighten.
20. Install hydraulic pipe with attached flow divider from the back side of the machine sliding it under center cross frame toward the front. Place the second hydraulic pipe on top and secure with double pipe clamps.
21. Attach 3" x 8" welded hydraulic cylinders (see drawing on page 31 – item # 11) with rod ends facing away from bucket to the tire axle.
22. Install 41" hoses into the lower port of the cylinders and upper set of cross pipes. Install the 33" hoses into the upper port of the cylinders and the lower set of cross pipes. Use thread sealant on all pipe and hose joints. Support the piping with five double pipe clamps. Use five 5/16" NC x 2-1/2" bolts, lock washers and hex nuts.
23. Install two short cross rods between the center cross frame and the rear inside frame. Use two 5/8" NC x 2" bolts, lock washers and hex nuts at center cross frame and two 5/8" NC x 2" bolts, lock washers and hex nuts at the rear inside frame end. Leave the rod assemblies loose.
24. Now install the two long cross rods between the rear inside frame and the rear cross frame. Use two 5/8" NC x 2" bolts, lock washers and hex nuts at the rear end of the main frame and two 5/8" NC x 2" bolts, lock washers and hex nuts at the rear inside frame end. Leave the rod assemblies loose.
25. Tighten up all eight cross rod attaching bolts.
26. Tighten up all four cross rod turnbuckles sufficiently to square up the frames. Install the cross rod U-bolts (see drawing on page 11 – item # 35).
27. Make a final check of the assembled Land Leveler. Cross rods should be tightened. The jam nut should be locked up against the turnbuckle. The front turnbuckle must be adjusted correctly. Lock pins should be in place. Make sure all frame and cross member bolts are tight. 8" U-bolts must be tight and positioned correctly on the rear cross frame. Grease all zerk fittings prior to operation.

## TO TRANSPORT FOLDING TRI PLANE ON THE ROAD:

1. Move the bucket to its lowest position and install the cylinder locking bars. The tire axle will be up and lock pins in place. Remove both lock pins from the tire axle. Lower the tire axle hydraulically until the lock pins can be reinserted into the same holes. This will lock the wheels into the transport position with the rear steel wheels off the ground.
2. Fold wing buckets forward and pin in place with red lockout pins provided. Tighten top link ratchets to eliminate any wing movement. Secure wings to the main frame using safety chains with hooks.
3. Fold rear steel wheel pivot frames back and pin in place with lockout pins provided.
4. Adjust the front turnbuckle to hookup to the tractor drawbar, and then readjust for the wheel/ground clearance desired.
5. Align the tongue with the frame center line; insert the pivot shaft lockout pin, with the wrench portion up, between the frames and through the rear hole of the front main frame pivot shaft.
6. **Do not try to move the Land Leveler on the road on its steel wheels. Always use the transport wheels when moving on roadways.**

## TO LOWER LAND LEVELER FOR LAND LEVELING:

1. Lower the tire axle hydraulically enough to remove the locking pins. Raise the tire axle slowly until the front or rear wheels touch the ground. Adjust the front turnbuckle until the pins are free. Remove the turnbuckle and mount it on the left pull brace with two lynch pins.
2. If the machine does not have a hydraulically actuated bucket, lift arm locks must be used on each side.
3. Remove the pivot shaft lockout pin, the 1" shaft between the front ends of the frame; place it in the pin holder bracket at the front of the machine.
4. The bucket leveling and depth adjustments are made by adjusting the lift screws located on each side of the Land Leveler.
5. Unfold rear steel wheel frames and secure them in place with 1" X 3-1/2" cap screws with lock washers and hex nuts.
6. Loosen wing lockout ratchets to remove lockout pins and unfold wings. Adjust truss rod lengths if needed. Fasten wings to the main frame bucket mating plates with 1" x 2-1/2" cap screws with lock washers and hex nuts.
7. Check the rear wheels for travel alignment:
  - a. Loosen both stabilizer bearing cap screws to assure that the bearing or roller is free to move in the slot.
  - b. Stretch a string from the outside of one wheel rim to the outside of the opposite wheel rim approximately 14" off of and parallel to the ground.
  - c. Adjust each wheel so that the string touches the full surface of each wheel rim with no bend in the string. (Visually check from outside of one wheel to the outside of the other)
  - d. Retighten the bearing or roller cap screws in the stabilizer.
  - e. Remove the string and now the Land Leveler is ready to use.
6. Operating the machine under adverse conditions, such as extremely rough ground, rocks or stumps, may cause the hitch end bolt to break. If this occurs, do not replace the factory installed bolt with a case hardened bolt. It is intended to be a safety shear pin.
7. **Hydraulic Cylinder option.** Adjust cylinder adjusting screw, located on the piston end of the bucket cylinder, so that the pivot point (A) is located 1/8" forward of a direct line between the upper turnbuckle; attach point (B) and the lower attach point (C) on each side of the machine. (See Drawing on the following page)
8. Adjust the bucket lift turnbuckle to "Level", set blade and working height of the bucket.
9. Recheck adjustment No. 7 above, to make sure pivot point is within tolerance (0" to 1/8"). If necessary, readjust No. 7 and No. 8 above.

# T.G. SCHMEISER CO., INC.®

## Limited Warranty Statement

T. G. Schmeiser Co., Inc. warrants each new Schmeiser® product to be free from defects in material and workmanship. This warranty is applicable only for the normal service life expectancy of the product or components, not to exceed twelve (12) consecutive months from the date of delivery of the new Schmeiser product to the original purchaser.

Genuine T. G. Schmeiser Co., Inc. replacement parts and components will be warranted for 90 days from date of purchase, or the remainder of the original equipment warranty period, whichever is longer.

Under no circumstances will it cover any merchandise or components thereof, which, in the opinion of the company, has been subjected to misuse, unauthorized modifications, alteration, an accident or if repairs have been made with parts other than those obtainable through T. G. Schmeiser Co., Inc.

The Company in no way warrants engines, batteries, cylinders, tires or other trade accessories since these items are warranted separately by their respective manufacturer. Expendable components such as points, shanks, blades, rings, bearings, teeth, and the like are excluded from this warranty.

Our obligation under this warranty shall be limited to repairing or replacing, free of charge to the original purchaser, any part that, in our judgment, shall show evidence of such defect, provided further that such part shall be returned within thirty (30) days from date of failure to T. G. Schmeiser Co., Inc., routed through the dealer and distributor from whom the purchase was made, transportation charges prepaid.

This warranty shall not be interpreted to render T. G. Schmeiser Co., Inc. liable for injury or damages of any kind or nature to person or property. This warranty does not extend to the loss of crops, loss because of delay in harvesting, or any expense or loss incurred for labor, substitute machinery, rental or for any other reason.

Except as set forth above, **T. G. Schmeiser Co., Inc. shall have no obligation or liability of any kind on account of any of its equipment and shall not be liable for special or consequential damages. T. G. Schmeiser Co., Inc. makes no other warranty, expressed or implied, and, specifically, T. G. Schmeiser Co., Inc. disclaims any implied warranty or merchantability or fitness for a particular purpose. Some states or provinces do not permit limitations or exclusions of implied warranties or incidental or consequential damages, so the limitations or exclusion in this warranty may not apply.**

This warranty is subject to any existing conditions of supply, which may directly affect our ability to obtain materials or manufacture replacement parts.

T. G. Schmeiser Co., Inc. reserves the right to make improvements in design or changes in specifications at any time, without incurring any obligation to owners of units previously sold.

No one is authorized to alter, modify or enlarge this warranty nor the exclusion, limitations and reservations.

**WARRANTY VOID IF NOT REGISTERED  
WITHIN 30 DAYS OF PURCHASE DATE**

# Notes

A large rectangular box with a black border, containing 18 horizontal gray bars for writing notes. The bars are arranged in a repeating pattern of a gray bar followed by a white bar, starting and ending with a gray bar. This provides a structured area for taking notes.
